

Major U.S. Heavy Equipment Manufacturer Solves Severe Chemical Attack Problems With ...

CHEMCLAD

One of the largest and most respected U.S. manufacturers of heavy equipment had a number of severe chemical attack problems in their chemical containment areas.

They evaluated a number of different chemical protection systems and eventually decided on CHEMCLAD from ENECON.

It was CHEMCLAD's outstanding resistance to a very wide range of caustics and acids that eventually convinced the plant engineers that CHEMCLAD would satisfy all of their

chemical protection requirements at this huge plant based in central Pennsylvania.

The local ENECON Field Engineer convinced the engineers at the plant that not only did CHEMCLAD offer the complete solution to most of their chemical corrosion problems, but that he would be present throughout the application of the materials in order to insure that proper surface preparation and installation procedures would be followed.
