

A Small Amount of DuraQuartz Solves a Big Problem for a Maryland Developer

A local real estate developer in Maryland was presented with a serious, yet unforeseen problem. He built 17 townhouses that back-up to a common alley. The local municipality, which owns the alley, installed new blacktop even with the curbs & driveways. This created a flooding problem when it rained and water from the alley spilled onto the driveways.

The municipal engineers looked at the flooding problem and then told the developer that local codes require that the curbs be ½ inch higher than the alley -

which they were before the new blacktop was installed.

The developer contacted his friend, Kevin Jason, who just happens to be the local ENECON Distributor in Maryland. Kevin sold him 4 units of DuraQuartz which were used to elevate the curbs to comply with the codes and eliminate the flooding issues. The developer was so impressed with the ease of use and the results obtained with the DuraQuartz that he immediately purchased additional units for stock.
