

ENECON DuraGrip System Provides Outstanding Slip-Resistance On Locomotives For Major North East Railroad

This locomotive belongs to one of the leading transit authorities in the U.S. *SafetyClad DuraGrip* was applied to its walkways and nose to create slip-resistance from oil and grease spills.

Black Beauty was used because the maintenance engineers preferred its color over aluminum oxide. As the final step in this process, all excess *Black Beauty* was swept away leaving a slip-resistant surface the engineers were looking for.

The areas were first prepared manually then cleaned. A layer of *DuraFill* was applied to wet out the entire area. A broadcast of *Black Beauty* abrasive was applied.

This same system is being planned for more of the locomotives in this fleet as well as on steps in their passenger train cars.
