CHEMCLAD XC Solves Tough Chemical Attack Problems in Containment Areas for Major Power Company.

A major power station in the northeastern U.S. had a serious chemical attack problem in one of their chemical containment areas.

The concrete had deteriorated from long-term exposure to aggressive acids and needed some immediate “first aid”.

John Huber, ENECON North East’s senior field engineering specialist, recommended CHEMCLAD XC as the best material to insure long-term protection.

After grit blasting, one coat of CHEMCLAD P4C was applied followed by two coats of CHEMCLAD XC.
