

\$25.00 Worth of SpeedAlloy Saves US Navy \$5,000.00

What could be easier?

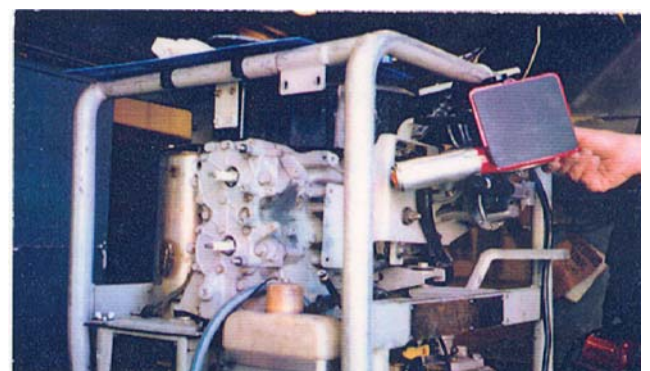

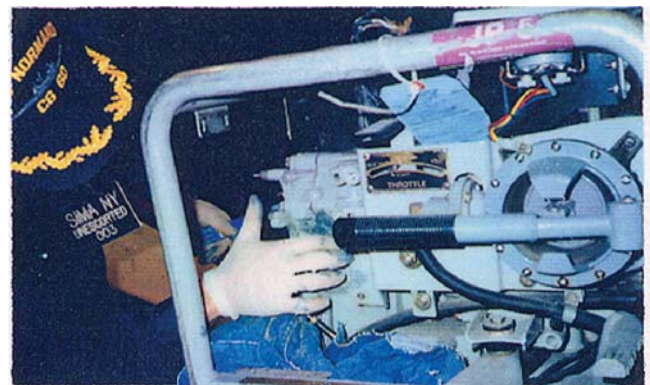

ENECON SpeedAlloy again proves itself to be the fast, easy and extremely cost effective solution to another seemingly small - yet very expensive - repair problem.

The aluminum block of this shipboard P-250 portable pump had a small crack in the water jacket making it inoperable.

Faced with a replacement cost of \$5,000 for a new engine block casting - and after attempting the repair unsuccessfully with a conventional, epoxy material - the SIMA facility turned to ENECON for a fast, effective solution.

Armed only with ability, knowledge and SpeedAlloy...a winning combination...Bob Barr of **ENECON North East** arrived on the scene to help the Navy make the repair. The unique, pre-measured A-Pack impressed everyone with it's ease and simplicity of use.

It's the cleanest and safest polymer composite available on the market today. The mixed SpeedAlloy was applied to the already prepared area and worked well into the surface with a gloved hand, completing the repair.
